Psychotherapy Basics — Demo Knowledge Base

General educational sample content for testing retrieval and grounded responses in an AI appointment assistant.

DEMONSTRATION CONTENT — fictional information for software testing only. These examples are invented, credentials are unverified, and this material is not clinical advice.

Important note

This simplified document is educational demonstration content, not diagnosis, treatment advice, a clinical protocol or a substitute for a qualified professional. Have real content reviewed before deployment.

What is psychotherapy?

Psychotherapy is a broad term for structured conversations and psychological approaches intended to help people understand concerns, develop coping skills and work toward agreed goals.

The approach, length and format vary with the person's needs, the practitioner, the setting and the agreed care plan.

Cognitive behavioural therapy (CBT)

CBT explores connections among thoughts, emotions, physical sensations and behaviours.

Depending on a person's needs and the therapist's training, CBT may involve identifying unhelpful thinking patterns, practising coping strategies, problem-solving and working toward agreed goals.

A general description cannot determine whether CBT is suitable for a particular person; individual assessment by a qualified professional is needed.

What might happen in an initial session?

An initial appointment may include discussing what brought the person to therapy, their goals, relevant background, confidentiality and its limits, service procedures and whether the service seems appropriate.

Processes vary by provider. People can ask about session length, fees, cancellation rules, accessibility and what to expect.

Choosing a therapist

People may ask about qualifications, registration where applicable, training, experience with their concern, therapeutic approach, fees, session format and confidentiality practices.

A chatbot should not invent credentials, claim a specialisation without supporting information or guarantee outcomes.

Privacy and boundaries

A real service should explain how appointment and clinical information is collected, used, stored and protected.

An appointment assistant should not present itself as a therapist. Urgent or high-risk concerns should be directed to appropriate human or emergency support.

RAG grounding rules

Answer document-specific questions only when retrieved passages support the answer.

If the documents do not contain a requested fact, say that the available information does not specify it instead of guessing.

This small demo knowledge base is not clinically reviewed and must not be the sole basis for health-related guidance.

Example RAG test questions

What does this document say psychotherapy is?

What might be discussed in an initial session?

What does this document say about CBT?

Does the document say CBT is suitable for everyone? No; individual assessment is needed.
